

To learn more: Arrange-Act-Assert

There is another widely used methodology for constructing the reasoning behind how tests work called ***Arrange-Act-Assert*** or simply **AAA** . This methodology also consists of 3 steps for constructing a test, analogous to the ***Given-When-Then*** steps .

- ***Arrange*** : The non-literal translation would be something like **organize** . The organization, in this case, would be focused on the preliminary steps necessary to assemble the initial context of the test;
- ***Act*** : The non-literal translation would be something like **act** . In this case, it would be the action that starts from the steps organized in the first stage and leads to what we will find out at the end;
- ***Assert*** : The non-literal translation would be something like **ascertain** . In this case, we ascertain that the outcome brought about by the action is really the one we expect.
