Do as I did in class

Let's set up an environment that forces developers to maintain the correct code style, blocking one `commit` if they don't.

1. [Enter the Flake8 (https://flake8.pycqa.org/en/latest/)](https://flake8.pycqa.org/en/latest/) website .
2. Install by `flake8` running the following code in your terminal:

```
pip install flake8
```

COPY CODE

3. To check for style errors, `commit` run the following command:

```
flake8 --install-hook git
```

COPY CODE

4. Now you need to run the command that will block them `commits` when there is an error.

```
git config--bool flake8.strict true
```

COPY CODE

Done! Your environment is now configured to block `commits` on code style issues.

Instructor's opinion

Remember that for this exercise to work you need to have a git repository initialized. If you have any difficulty with this, review the "To learn more" exercise in this lesson.
